What is a Laminectomy?

Laminectomy (spine decompression) is a surgical procedure performed to remove pressure on the spinal cord or nerve root(s). The term *laminectomy* comes from the Latin words *lamina* (bony roof of the spinal canal) and *ectomy* (removal). Removing the lamina widens the space of the spinal cord or nerve root(s) and therefore relieves symptoms related to compression and irritation of the spinal cord or nerve root(s). These symptoms may include pain and/or numbness, tingling, burning, and weakness.

Sources of spinal cord or nerve root(s) compression such as herniated disc, bone spurs (arthritis), ligament build-up, or tumor may be removed during this procedure. A laminectomy may be performed in different regions of the spine, cervical (neck), thoracic (mid-back), and lumbar (low back).

Pre-Register for Surgery Online or by Phone

Pre-registration is a **two-step** process that is necessary for you to complete before having surgery at California Pacific Medical Center. Step one (1) involves registration of your insurance and personal information. Step two (2) involves speaking with a registered nurse (RN) who informs you of any necessary testing you may need before your surgery.

- 1. **Pre-register online at** <u>www.cpmc.org/services/pre-reg.html</u>. Click "Register online" for the campus where your surgery is scheduled. Follow the online instructions to complete the Surgery Pre-Admission form. This will take about 10 to 15 minutes. Be sure to have your insurance information when you complete the online form. You may also call (415) 600-2500 to speak with a registrar.
- Speak with a nurse by calling (415) 600-2500 no earlier than 2 weeks before
 your surgery. You may speak with a nurse at that time or schedule a phone
 appointment for a later time. Please have a current list of medications and
 supplements you are taking. The nurse informs you of any further testing you
 many need.

How Do I Prepare for Surgery?

- You may not eat or drink anything after midnight, the night before surgery, unless otherwise directed by your doctor. <u>Note</u>: However, you may continue to take your routine medications (for example, heart and blood pressure medications), on the morning of surgery with a sip of water.
- Consult with your surgeon if you are taking blood-thinning medications,
 NSAIDs, or Insulin. Examples include Coumadin (Warfarin), Plavix (Clopidogrel) and Aspirin; Nonsteroidal Anti-inflammatory Drugs (NSAIDs) such as Motrin (Ibuprofen), Aleve (Naproxen), Feldene (Piroxicam); or Insulin.

What Can I Expect During My Hospital Stay?

- Expect to stay about 1 − 3 days in the hospital.
- You will receive pain medication through the vein immediately following your surgery. Within a day or two, as the pain decreases, you will receive oral pain medication.
- Ask the nurse for pain medication 1 hour before beginning physical activities so that you will be able to get in and out of bed and walk with minimal discomfort.
- You will be encouraged to breathe deeply and turn in bed to prevent a lung infection after surgery.
- You will learn how to turn in bed using a logrolling technique (move your whole body as a unit from side to side without twisting the spine).
- Nurses and therapists will assist you with getting in and out of bed and walking.
 You will be encouraged to walk in your room or for a short distance the evening
 of your surgery. Gradually, your activity will be increased to include walking in the
 hallway.
- Physical and occupational therapists will assist you with proper bed mobility, transfers, walking, body mechanics, bathing and dressing techniques, and safety training.
- Speak with your surgeon's office about the timing of your first post-operative office visit.

Preparing to Go Home

How to Care for Your Incision and Dressing

- Keep your dressing dry and clean for 7 days after surgery to prevent infection.
- You may take a sponge bath until your sutures are removed.
- You may shower if you cover the incision with plastic wrap to keep it dry.
- Steri-Strips® (incision tapes) may be removed 7 10 days after surgery. Staples
 or sutures may be removed 7 14 days after surgery during your first doctor
 visit.
- Incision and dressing care may vary from patient to patient, please make sure you understand your surgeon's instructions before you leave the hospital.

Preparing to Go Home (continued)

Know Your Proper Body Mechanics and Activity Restrictions

- No bending or twisting of your back. Keep your back straight and bend your knees using your thigh muscles.
- No sitting in soft chairs or sofas that allow your back to curve. Limit your time sitting in a chair since sitting may cause discomfort. Sit and stand straight.
- No jogging. Frequent short walks are better than long walks.
- No lifting, no housework, and no yard-work during the 1st month or until allowed by your doctor.
- Sleep on a firm bed.

Follow the Guidelines for Physical Activity After Surgery

- Gradually increase your physical activity by alternating activity with rest periods.
- Plan for short walks with rest periods.
- Progressively increase your walking distance on a daily basis.
- Start your exercises **only** when you have been instructed by your surgeon.
- Begin your physical therapy program as ordered by your surgeon.
- In general, sexual activity may be resumed in a few weeks after surgery within the bounds of your comfort. Consult with your surgeon.
- Discuss returning to work during your doctor's appointment.

Manage Your Pain

- Your pain level may change from day to day and throughout the day. Pace your activities according to your level of discomfort. Plan for adequate rest periods.
- If you are feeling a moderate amount of pain, do less, and allow for more rest periods. Complete healing may require many months. Do not jeopardize your recovery by being over-active too soon.
- Adequate pain control is important to healing. Your surgeon will prescribe pain medication such as Norco or Vicodin (Hydrocodone and Acetaminophen), or Nonsteroidal Anti-inflammatory Drugs (NSAIDs) such as Motrin (Ibuprofen).
 - **Note:** Do not drive a car if you are taking narcotics or muscle relaxants. These drugs affect your judgment and reaction time.

Preparing to Go Home (continued)

- Some patients experience mild episodes of muscle spasms in the back and legs (after low back surgery) or in the neck and arms (after neck surgery). Heat/ice packs or muscle relaxants can be used to lessen the discomfort.
- If you have neck surgery without bone fusion, you may use a soft collar as needed for comfort during the day for 1 – 2 weeks if approved by your doctor.

When to Call Your Doctor

Call Your Doctor if You Experience Any of the Following Symptoms

- If you feel warm or chilled, take your temperature. Call your doctor with a temperature of 101 °F or 38.3 °C or above.
- Increasing redness and swelling at the incision site.
- Changes in the amount, appearance, or odor of drainage from your incision.
- New or increased changes in sensation/presence of numbness in extremities.
- Severe pain that is not relieved by medication and rest.
- Questions or problems not covered by these instructions.

More Ways to Learn

- Go to www.cpmc.org/learning.
- Visit the North American Spine Society Web site at www.spine.org and click on "Spine Conditions & Treatments."
- Go to the MedlinePlus Web site at <u>www.medlineplus.gov</u>, click on "Health Topics", then the letter "B" and then "Back Injuries."

Frequently Asked Questions

Question: What is a laminectomy?

Answer: Laminectomy is a surgical procedure performed to remove

pressure on the spinal cord or nerve root(s).

Question: How do I care for my incision after surgery?

Answer: For detailed instructions on caring for your incision, please refer

to page 3 of this handout.

Question: What are the guidelines for physical activity following

surgery?

Answer: Do not jeopardize your recovery by being over-active too soon.

Please refer to page 4 of this handout for detailed guidelines on

your physical activity following surgery.
